

## TITLE: A COMBINATION TYPE OF SOCKET WITH POWER

### SOURCE MANAGEMENT

### BACKGROUND OF THE INVENTION

#### (a) Field of the Invention

5       The present invention relates to a combination type of socket having a plurality of holes for the connection to other external electrical load and to provide voltage control, mounting and cutting off of abnormal current supply.

#### (b) Description of the Prior Art

10       Conventional type of socket for extension is normally an elongated socket body having a plurality of sockets being provided with fuse, power source switches and the functions of such type of socket are as follows:

- (1)       providing a multiple distribution of power source;
- (2)       manually controlling the electrical communication or cutting off of power supply; and
- 15       (3)       cutting off of current supply at excessive load to prevent short-circuited. In view of the above, it is understood that the conventional socket seat is merely functioned as a connection of power source without additional functions such as power source filter, surge absorption, noise reduction, abnormal current
- 20       indication and warning, low/high voltage indication, timing for

load, etc.

Accordingly, it is an object of the present invention to provide a combination type of socket with power source management which mitigates the above drawbacks.

## SUMMARY OF THE INVENTION

An object of the present invention is to provide a combination type of socket with power source management, comprising power source protection and filter body, multi hole output extension socket body, automatic timing  
5 socket body, synchronized main/secondary socket body, and the individual socket bodies are provided with plug and can be mounted to each other as a unit.

Yet another object of the present invention is to provide a combination type of socket with power source management, comprising a control circuit  
10 including a filter, surge absorption and noise reduction treating circuit, high/low current indicating/alarming circuit, high/low voltage indicating/alarming circuit, temperature fuse, excess voltage input prevention circuit, and with power source quality management and control functions.

Yet a further object of the invention is to provide a combination type of  
15 socket with power source management, wherein the multi hole output extension socket body is provided with a plurality of socket.

A further object of the invention is to provide a combination type of socket with power source management, further comprising circuit inspection circuit, amplification driving circuit, control circuit of clock/timing circuit such

that when a load is connected, automatic recordation of time utilization is activated.

A further object of the invention is to provide a combination type of socket with power source management, wherein the synchronized  
5 main/secondary socket body is provided with current inspection circuit, relays such that when the load of the main socket is activated or stopped, the secondary socket is also simultaneously activated or stopped.

Other objects, and advantages of the present invention can be more fully understood by reading the following detailed description of the preferred  
10 embodiment, with reference to the accompanying.

## BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a perspective view of the present invention.

Fig. 4B is a control block diagram of the synchronized main/secondary socket of the present invention.

## DETAILED DESCRIPTION OF THE PRESENT INVENTION

Referring to Fig. 1, 2A, 3A and 4A, there is shown a combination type of socket with power source management comprising a power source protection and filter body 10, a multi hole outlet extension socket body 20, an automatic timing socket body 30, and a synchronized main/secondary socket body 40. The power source protection and filter body 10 is provided with a main plug 11 for connection to a common power source and a power source switch 14, a temperature fuse FS and a socket 12 having extension outlet and for connection with other socket body. The socket body 20, 30, 40 are provided with input plug 21, 31, 41 and extension outlet socket 22, 32 and 42 for mutual plugging connection.

The power source protection and filter body 10 is provided with a power source quality processing circuit 101, excess voltage input-prevention circuit 102, low high current indication alarm circuit 103, low high voltage indication alarm circuit 104, and control circuit for voltage, current indicator 15, 16 such that after the power source is input, it is filtered, noise elimination, surge absorption treatment and the input voltage, current value are monitored and indicated and the current is cut off at abnormal or warning alarm is produced.

A normal close point b of a relay R21 is connected in serial between the excess voltage input prevention circuit 102 of the power source protection and

filter body 10, and the processing circuit 101, under normal condition, the normal close point b remains conductive to current and under abnormal condition, it is cut off, the alarm circuit 103 is provided with a current comparator CT to inspect the current size of the circuit, and a relay RL2 is  
5 connected in parallel to the processing circuit 101, under abnormal current condition, the relay RL2 is cut off and the buzzer B2 produces an alarming sound. The multi outlet extension socket body 20 is provided with a plurality of sockets 23 for external load of other appliance. The automatic timing socket body 30 is provided with an automatic timing socket 33 and a normal  
10 open point a of a relay RL3 connected in series, and a current inspection circuit 301, an amplification driving circuit 302, and a clock/timing circuit 303 with setting button 35 and timing display 34, and before the timing output socket 33 is mounted with a load, the timing display 34 indicates time function, and after the timing output socket 33 is mounted with a load, the timing  
15 function is automatically activated and the application time of load is recorded.

A current comparator CT is provided on the current inspection circuit 301 of the automatic timing socket body 30 to inspect current and is connected in series with the amplification driving circuit 302 and is input with a clock/timing circuit 303, and the clock/timing circuit 303 is provided with a  
20 relay RL3 connected in series with the normal open point a circuit and, when

the timing output socket 33 is mounted with a load, the relay RL3 is electrically connected and the current comparator CT senses the current passage to the load and is then input to the clock/timing circuit 303 and the application time is totaled and displayed on timing display 34.

5       The synchronized main/secondary socket body 40 is provided with a main, a secondary output socket 43, 44, and the main output socket 43 is directly connected in parallel to the circuit, the secondary output socket 44 is connected in series to the normal open point a of the relay RL4, and is provided with a current inspection circuit 401, an amplification driving circuit  
10 402, and the main and the secondary output socket 43, 44 are synchronized when the main output socket 43 is cut off, the secondary output socket 44 is also cut off.

The circuit of the main output socket 43 is connected to the current comparator CT mounted with a current inspection circuit 401 and is then  
15 connected to the amplification driving circuit 402 and the amplification driving circuit 402 is provided with a relay RL4, the normal open point a of the relay RL4 is connected in series to the circuit, thus, when a load is connected to the main outlet socket 43 to generate current, the current inspection circuit 401 detects the current and the amplification driving circuit  
20 402 is initiated, i.e., the relay RL4 is electrically connected and the secondary

output socket 44 is provided with current, on the contrary, if the load is not applied, the relay RL4 will not provide current to the secondary output socket 44.

In accordance with the present invention, in application, the power source protection and filter body 10, multi hole outlet extension socket 20, automatic timing socket body 30, synchronized main/secondary socket body 40, are mounted to each other to form an integral unit. Also, the individual socket body can individually plug onto a general socket.

In accordance with the present invention, the control and advantages of the individual socket body are as follows:

(1) Power source protection and filter body 10:

Referring to Figs. 2A, 2B, the power source enters through the excess voltage input-prevention circuit 102 and is connected in series to the normal closed point b of a relay RL1, and in combination with the current comparator IC1 and the monitoring control of Integrated Circuit IC<sub>2</sub>. The voltage display device 15 indicates the voltage condition, and if it exceeds the preset value, the relay RL1 will cut off and the normal closed point b becomes the state of normal opened, and the current is cut off, and the normal open point a of the relay

RL1 will become open, and the buzzer B2 will produce an alarm sound. The input power source is filtered by a power source quality processing circuit 101 to eliminate noise and surge such that the power source has a better quality. In addition, the current comparator CT can detect the current in the circuit and after the monitoring control of the integrated circuit IC3, IC4, the current indicator 16 indicates the present status. If it exceeds the preset value, the other relay RL2 will cut off, and the buzzer B2 will produce an alarming sound.

(2) Automatic timing socket body 30.

Referring to Figs. 3A, 3B, when the output socket 33 does not connect with a load, the inspection circuit 301 detects no current (RL3 being cut off), and the display 34 of the clock/timing circuit 303 displays the time. When a load is connected, the circuit 301 will detect a change of current value and the relay RL3 of the clock/timing circuit 303 is triggered, and the normal open point a is closed to provide power source to the load, and the current comparator CT detects the current, i.e., the clock/timing circuit 303 provides the timing function and the

time utilized by the load is totaled. Also, the preset button 35 can use to set the require time.

(3) Synchronized main/secondary socket body 40.

Referring to Figs. 4A and 4B, when the main output socket 43  
5 does not connect with load, or the load is not operating (being  
opened circuit), the comparator CT detects no current and the  
relay RL4 of the amplification driving circuit 402 will not have  
any action. The normal opened point a is not in  
communication and the secondary output socket 44 is an opened  
10 circuit. When a load is connected to the main output socket 43,  
the comparator CT will detect the current and via the  
amplification driving circuit 402, the relay RL4 is triggered, and  
the normal opened point a is closed for communication and  
power source is provided to the secondary output socket 44. In  
15 view of the above, the power source of the secondary output  
socket 44 is dependent on the application of load and the  
communication of load.

In accordance with the present invention, the present device can be  
used on a host computer and other peripherals as follows:

- 5 (1) The power source protection and filter body 10 provides power source with low noise and surge will allow more stable function for the host computer and other peripherals. Any abnormal voltage or current, the current is automatic cut off and the computer is thus protected and an alarming sound is produced to warn the user to stop using the computer.
- (2) Multi hole output extension socket 20 may not be used or used with other electrical load.
- 10 (3) Automatic timing socket body 30 can calculate the total time of utilizing the computer.
- (4) The synchronized main/secondary socket body 40 allows simultaneous cut off of power source supply to other peripheral.

Although the preferred embodiment of the invention is described hereinabove, it should be clear that any number of alterations could be made

15 thereto without departing from the scope of the invention is claimed.
